Abstract:

Abstract

The **Smart Medicine Availability and Alternative Finder** is a system designed to help users quickly find medicines and check their availability in different pharmacies. Sometimes, a medicine may not be available in one pharmacy, so the system helps users find other nearby pharmacies where it may be available.

The system also provides information about possible alternative medicines based on their composition and category. It includes features such as **nearby pharmacy search, prescription verification, medicine availability notifications, and pharmacy inventory updates.**

The project uses **Service-Oriented Architecture (SOA)**, where different functions are developed as independent services and communicate through APIs. This makes the system flexible, secure, and easier to maintain. The main technologies planned include **React/HTML-CSS-JavaScript, Java Spring Boot, MySQL, REST APIs, JWT, and location APIs.**

Overall, the system aims to make medicine searching **faster, easier, and more convenient** by connecting medicine information, pharmacy availability, location services, alternatives, and notifications in one platform.
